## **Gramoflor decorative pine bark – all-round talent in the garden**

The substrate manufacturer Gramoflor has expanded its exclusive Gramoflor potting soil line by four different types of decorative pine bark with 3-8 mm, 8-15 mm, 15-25 mm und 25-45 mm grains.

As a result of the last few years strongly declining availability of raw bark, increasingly worse qualities get on the market. To ensure that it can continue to provide its customers with premium qualities of the variety *Pinus maritime*, the North German company is subjecting all pine bark to very strict quality controls and guarantees to its name for the selected first-class products. Gramoflor decorative pine bark protects the underground from drying out and provides more balanced soil temperatures. In a sufficient thickness, it also prevents seed germination of weeds.

Besides its use as a natural and durable soil conditioner, the product is suitable for the decoration of all garden areas. The red color is a charming contrast to leaves, flowers and lawns. Flower beds, trees and footpaths are better brought to the attention with Gramoflor decorative pine bark. Graves in particular obtain by the fine grain a noble appearance.

The four types of decorative pine bark are seamlessly incorporated into the high-quality product collection as well as into the eye-catching packaging design of the Gramoflor line and complete perfectly the exclusive assortment of Gramoflor for selective retailers.
